Peripheral Nerve Injuries in Athletes | SpringerLink

Peripheral nerves are susceptible to injury in the athlete because of the excessive physiological demands that are made on both the neurological structures and the soft tissues that protect them. The common mechanisms of injury are compression, traction, ischaemia and laceration. Seddon's original classification system for nerve injuries based on neurophysiological changes is the most widely ...

Peripheral Nerve Injuries in the Athlete | SpringerLink

Peripheral nerve injuries in athletes may serve as a diagnostic challenge for the treating clinician. They may present as acute injuries or secondary to overuse. Athletes are vulnerable due to the repetitive nature of upper- and lower-extremity movements and the superficial nature of peripheral nerves.

Injuries to the peripheral nerves are relatively common, and, if unrecognized can have a devastating effect on the athlete. These nerves can be damaged especially by compression or traction. When nerves such as the common peroneal nerve at the proximal fibula head or the ulnar nerve at the medial epicondyle of the elbow are lying superficially, they can be compressed by excessive pressure.
