Flower structure and pollination mechanisms
A flower, sometimes known as a bloom or blossom, is the reproductive structure found in flowering plants (plants of the division Magnoliophyta, also called angiosperms).The biological function of a flower is to affect reproduction, usually by providing a mechanism for the union of sperm with eggs. Flowers may facilitate outcrossing (fusion of sperm and eggs from different individuals in a ...

Flower - Wikipedia
There are two main types: protandry and protogyny. In protandry, the stamens or anthers develop ahead and the pollen grains mature and are shed before the pistils or the stigma become mature and receptive.

Mechanisms of Cross-Pollination in the Angiosperms
Richard Pallardy received a B.A. in English from Illinois State University in 2005. He was a research editor with Encyclopaedia Britannica, Inc. from 2008 to 2016 and worked on Britannica Blog from 2010... AdstockRF There's no brain in a cabbage. That's axiomatic. But the lack of a central ...

9 Plant Defense Mechanisms | Britannica
In 1908, he published Part 1 of Types of Floral Mechanism (Clarendon Press 1908) which was intended to be the first volume of an account of "The Hundred Best Flowers" as a way of providing a general explanation of floral morphology. It comprises large coloured and uncoloured illustrations of 12 different types of flowers and associated text.

Types of Floral Mechanism by Arthur Harry Church - AbeBooks
There are two types of self-pollination: in autogamy, pollen is transferred to the stigma of the same flower; in geitonogamy, pollen is transferred from the anther of one flower to the stigma of another flower on the same flowering plant, or from microsporangium to ovule within a single (monoecious) gymnosperm.

Self-pollination - Wikipedia
Pollination is a biological process in which the pollen grains are transferred from an anther (male part of a flower) to the stigma (female part of a flower). There are two types of pollination: Self-Pollination; Cross-Pollination

Types of Pollination- Self and Cross Pollination in Plants
Eternal blooms with dried artificial flowers. Dried, silk, foam or plastic flowers all offer a reliable alternative to fresh flowers. Durable plastic foliage and trees make ideal outdoor decorations, while more delicate foam or silk flowers are perfect for a small bunch of flowers to either walk down the aisle or to brighten a room in a vase.

Pollination - Pollination - Agents of pollen dispersal: The ancient principle of trapping insects as a means of ensuring pollination was readopted by some advanced families (e.g., orchids and milkweeds), and further elaboration perfected the flower traps of primitive families. The cuckoopint (Arum maculatum), for example, attracts minute flies, which normally breed in cow dung, by means of a ...

JW Schmidt/Wikimedia Commons/CC BY 3.0. Almost all prokaryotes undergo a type of asexual reproduction called binary fission. Binary fission is very similar to the process of mitosis in eukaryotes. However, since there is no nucleus and the DNA in a prokaryote is usually just in a single ring, it is not as complex as mitosis. Binary fission starts with a single cell that copies its DNA and then ...
